Errors in a Data Flow Diagram

Context-Level Data Flow Diagrams

- Focus is on the data flowing into and out of the system and the processing of the data.
- Shows the scope of the system:
 - What is to be included in the system.
 - The external entities are outside the scope of the system.

The Basic Symbols of a Data Flow Diagram (in context diagram)

Context diagram for grading system

CONTEXT DIAGRAM FOR Online clinic management system

CONTEXT DIAGRAM FOR AN ATM SYSTEM

The ATM must be able to provide the following services to the customer:

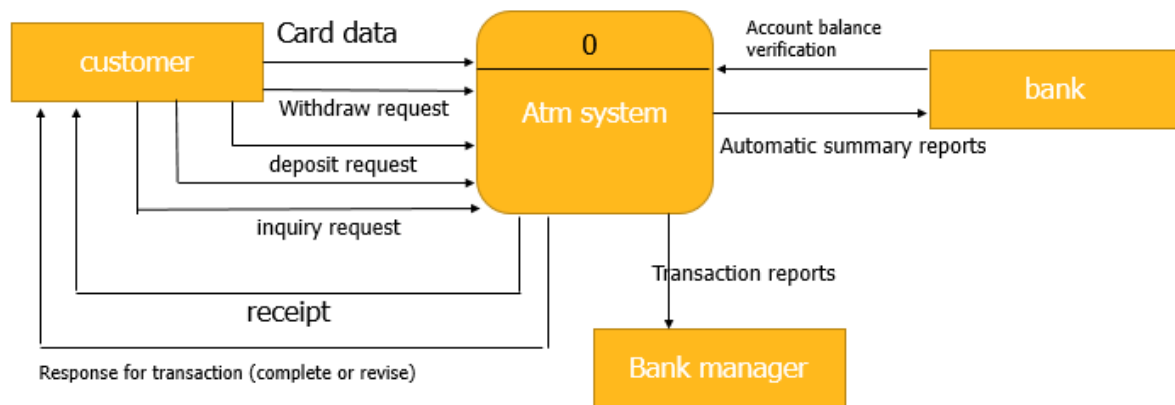

A customer must be able to make a cash withdrawal from any suitable account linked to the card. Approval must be obtained from the bank before cash is dispensed.

2. A customer must be able to make a deposit to any account linked to the card, consisting of cash. The customer will enter the amount of the deposit into the ATM, then the verification will be conducted by the machine for approval.

3. A customer must be able to make a balance inquiry of any account linked to the card.

4. The ATM will provide the customer with a printed receipt for each successful transaction, showing the date, time, machine location, type of transaction.

The bank manager should receive a transaction report.

Practice 1

- Letters of complaint received from citizens are entered into a complaints master file by the City Clerk's office. The date, department code, and a complaint description are stored for each letter. Weekly reports are produced from the complaints master file and given to the City Manager. Two weekly reports are produced: a department summary and a detail report of complaint.

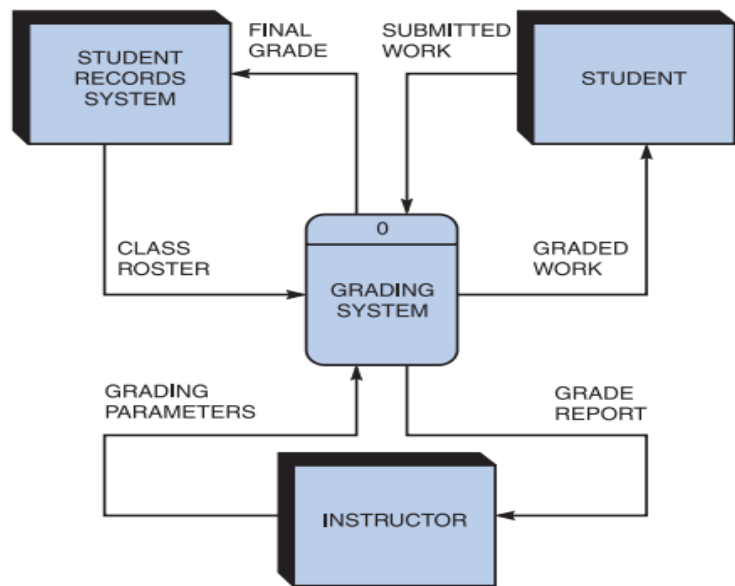

Practice 2

Perfect pizza wants to install a system to record orders for pizza and chicken wings. When regular customers call perfect pizza on the phone, their phone numbers goes automatically into the system.

The phone number invokes the name, address, and last order date comes automatically up on the screen, once the order is taken the total including the tax and delivery is calculated. Then the order is given to the cook. A receipt is printed. Special offers is printed so the customer can get a discount. Drivers who make deliveries give customer a copy of the receipt and offer (if any). Weekly totals are kept for comparison with last year's performance.

Construct a context diagram for Perfect pizza.

description	This process receive the customer data and store this customer data in a database so we can make use of this data in advertisements an in reports and so on

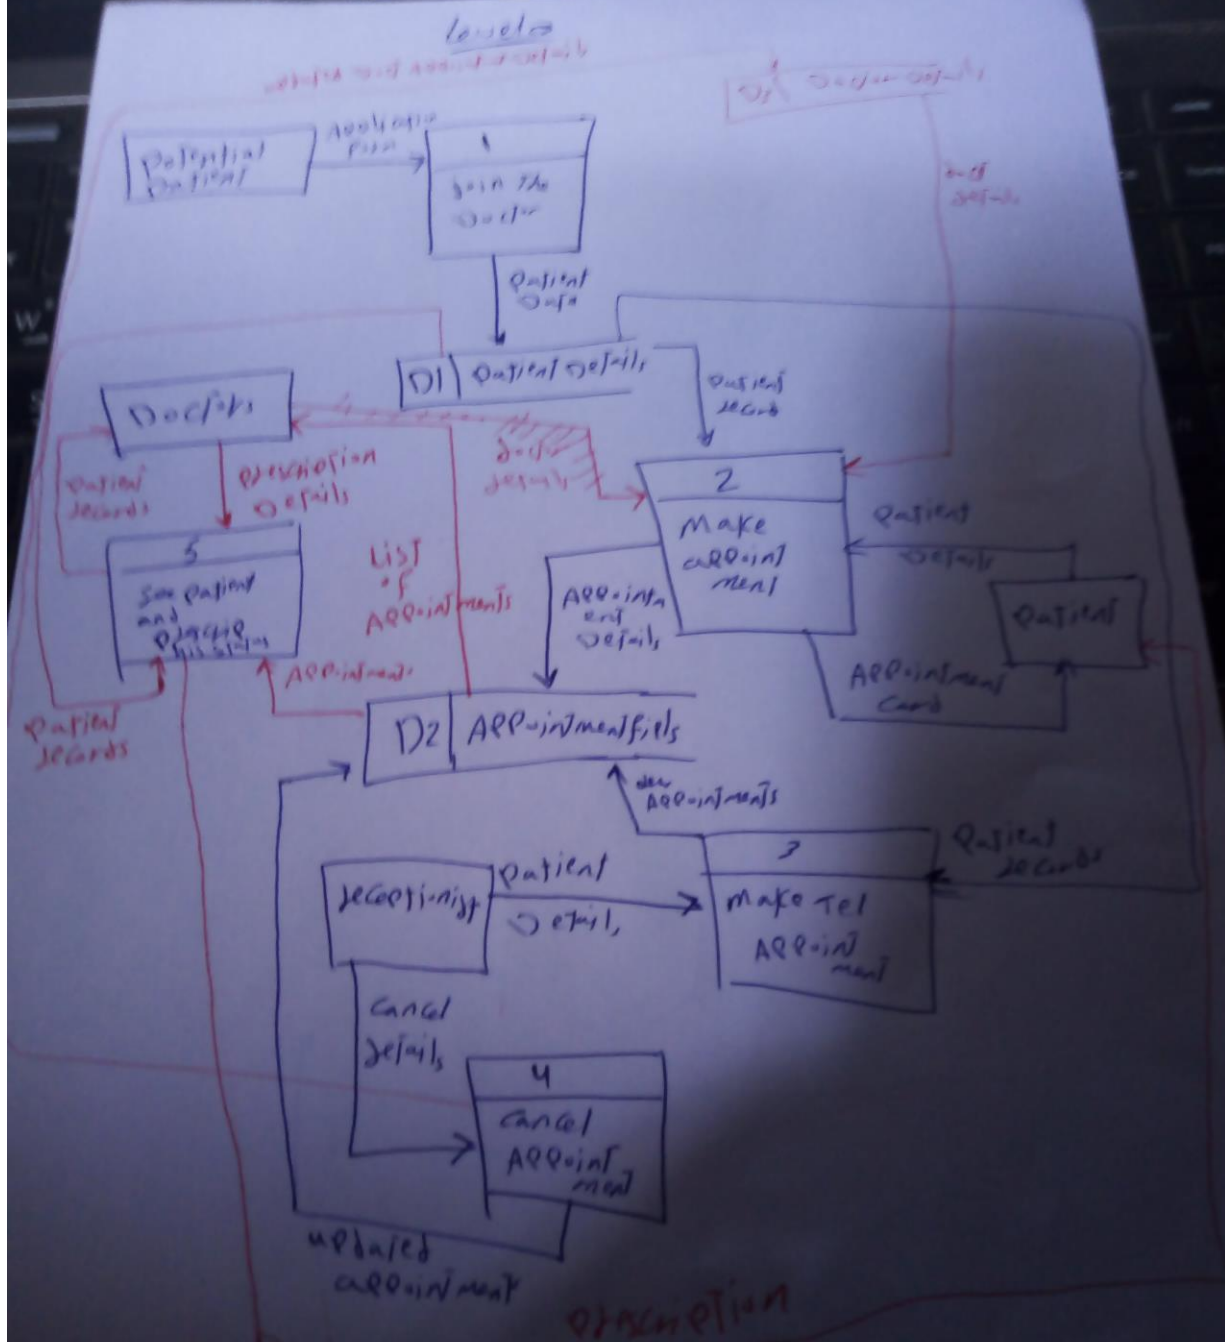

And so on for all process

Scenario examples

3: A potential patient joins the doctor by submitting a patient application form. A new patient record is created and stored in the patient records store. A patient make an appointment by providing their patient details. An appointment card is given to the patient after they have made the appointment, the appointment details is stored in a database, a receptionist makes a telephone appointment for a patient by entering patient details, a receptionist also cancel the appointment for a patient by entering their cancelation details both process update the appointment section database. A doctor will see a patient when they see a patient list of appointment and a patient records will be sent to the doctor. The doctor may want to issue a prescription by entering prescription details into the system. And the prescription will be issued to the patient.

Draw context diagram, level0, level 1

2: online car rental system:

System requirements: the system should allow the customer to see available cars and rental rates and to make online reservation.

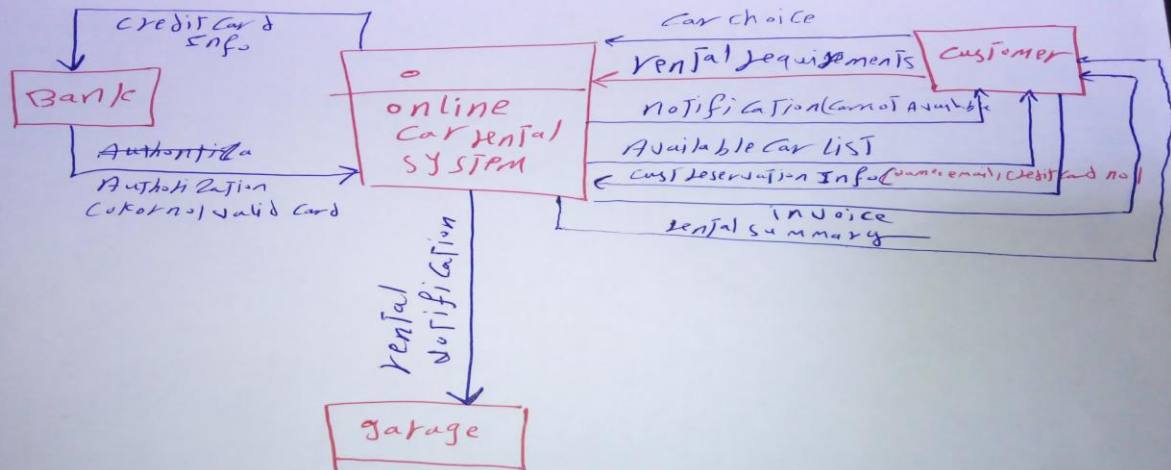

The customer deal with the system by sending their rental requirements. The system should provide the customer with a notification if the car is not available and a list of available cars if the car requirements are available then the customer chooses or selects the car. The customer also sends their reservation car info (name, email, credit card number). There are also banks that make authentication on credit card information. The system sends invoice and rental summary (total price, car he selected, date,...) to the customer. If the car is booked or reserved the system sends rental notification to the garage.

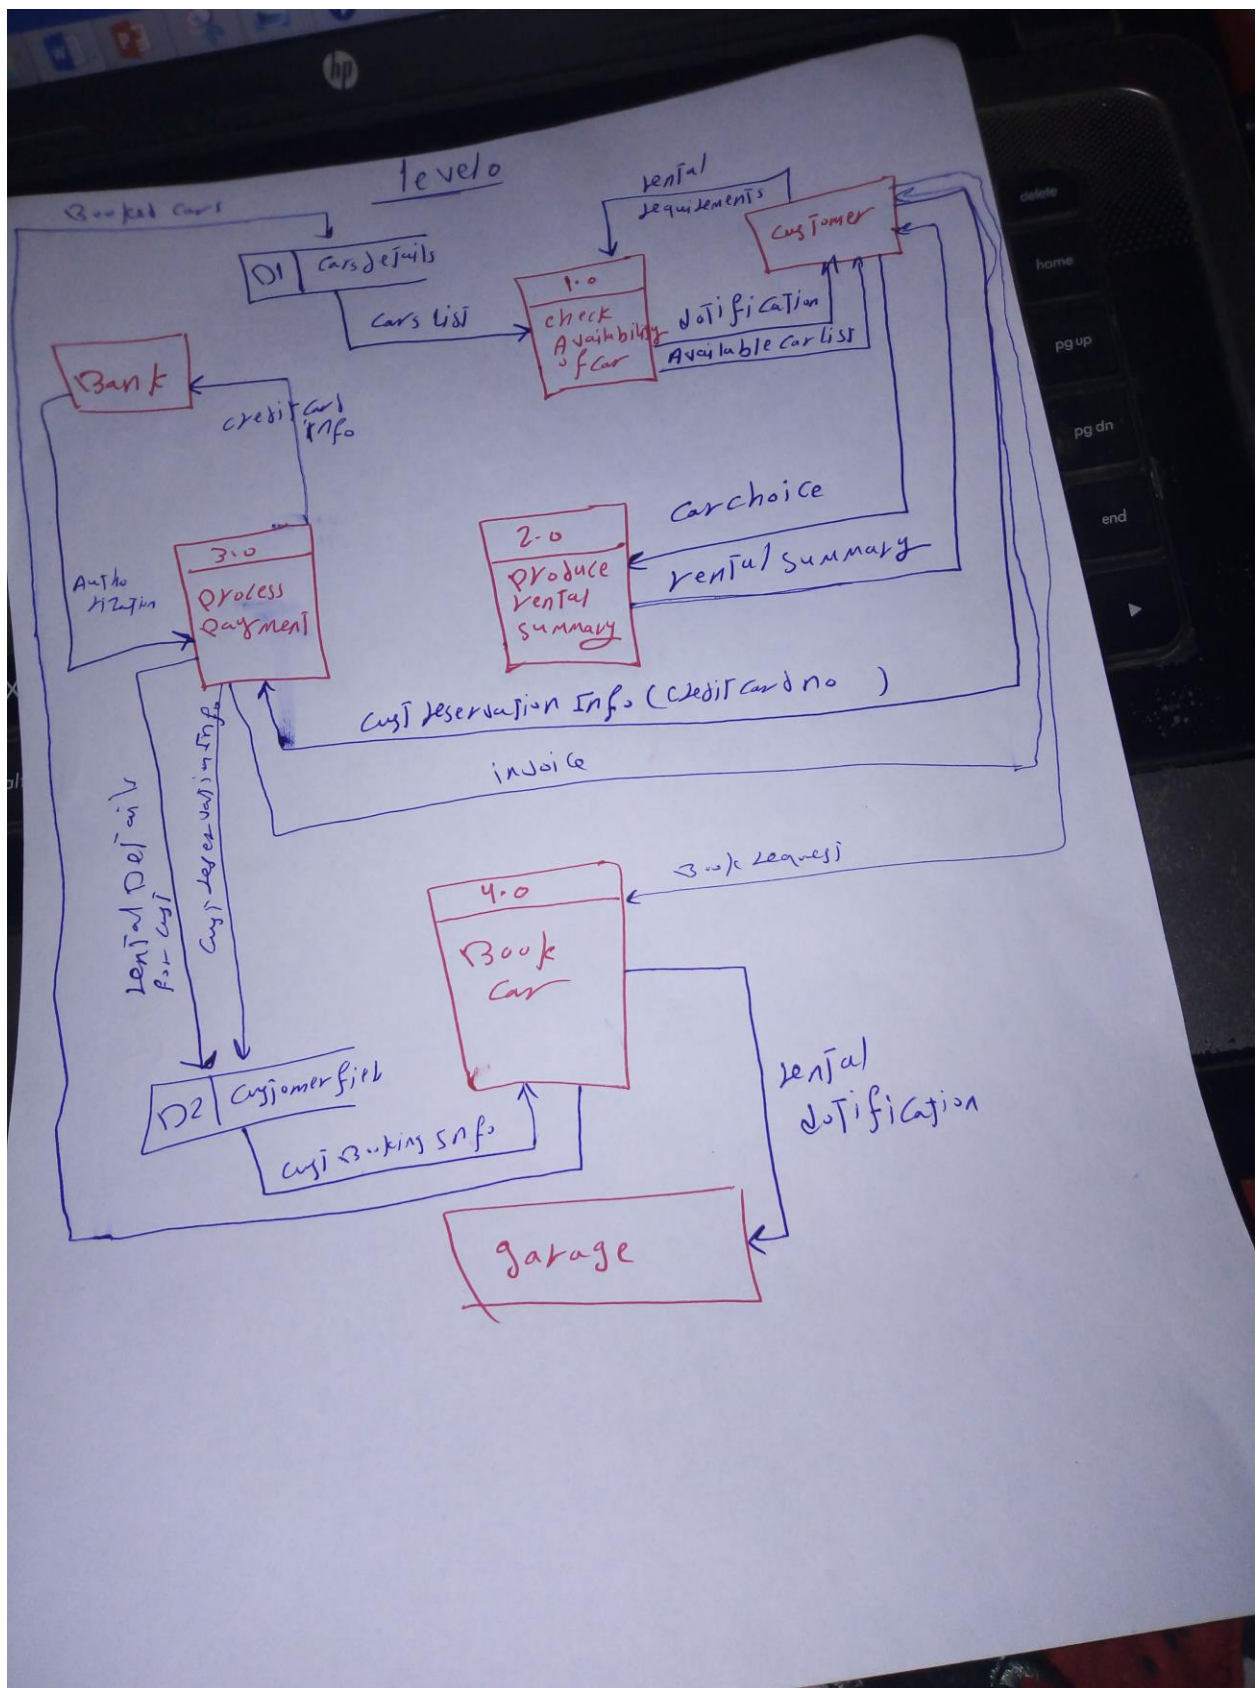

You should store the car details and the customer details.

You have four processes:

- 1: check availability of car
- 2: produce rental summary
- 3: process payment
- 4: book car

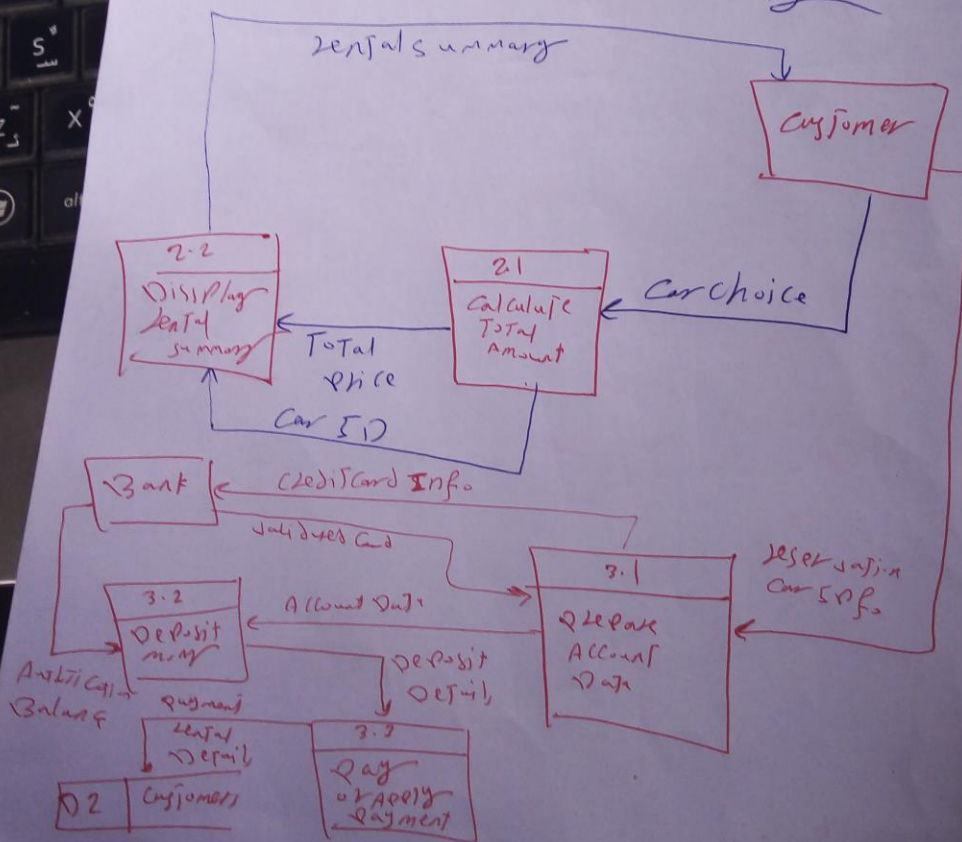

Draw context diagram, level 0, level 1

level 1

The process of produce rental summary
include total price so we need to calculate
the total price this process divided into 2 process
⇒ Calculate Total Price ⇒ Display Rental Summary
and the process of payment {insert credit card info
⇒ Deposit Amount
⇒ Apply Payment)
and so on let's take the example of
process produce rental summary

An airline reservation system is managing online booking ticket for customers.

Customers can do the following:-

1. Search for flights
2. Booking a ticket
3. Canceling a booking
4. Pay and confirm booking (confirmation is done after the Bank confirm the payment process)
5. Print the ticket after confirmation

The manager of the system uses it for generating reports for Monitoring the airline activities.

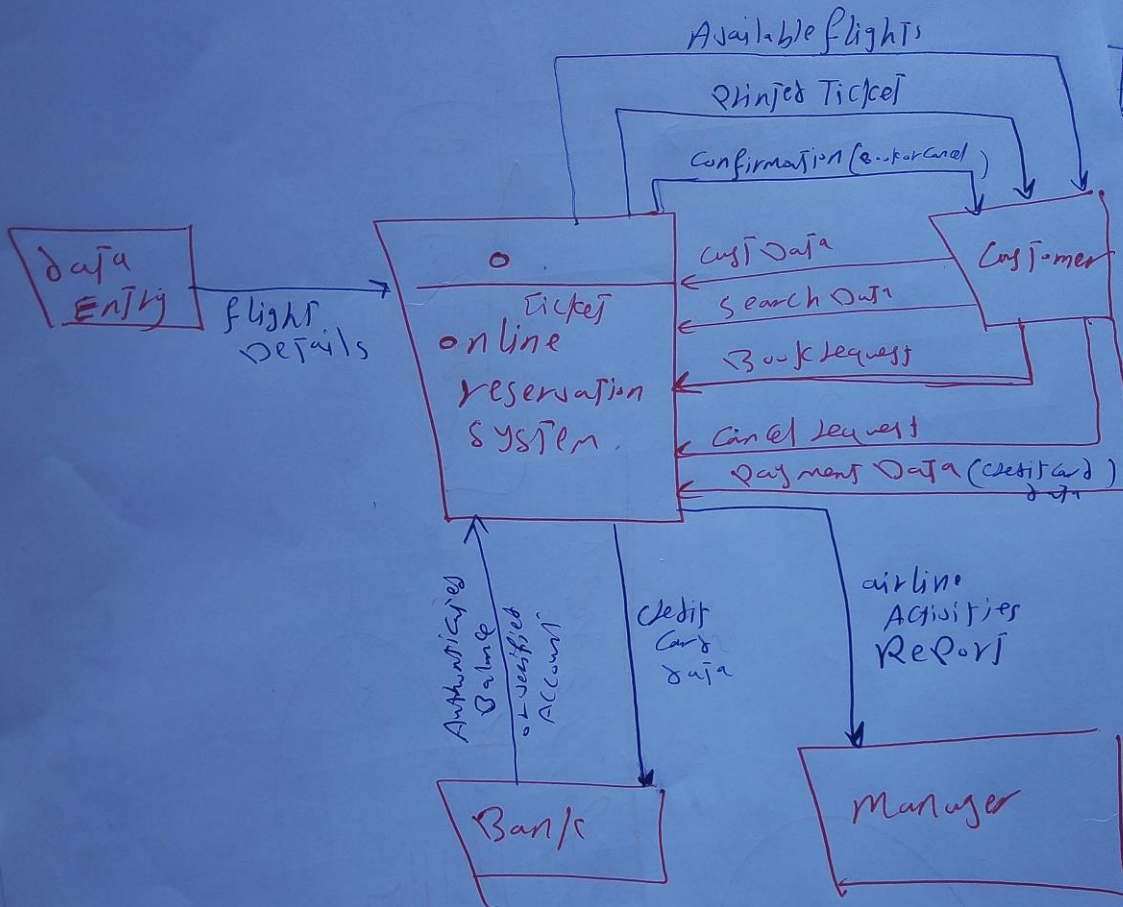

The flights details information is enter by a data entry.

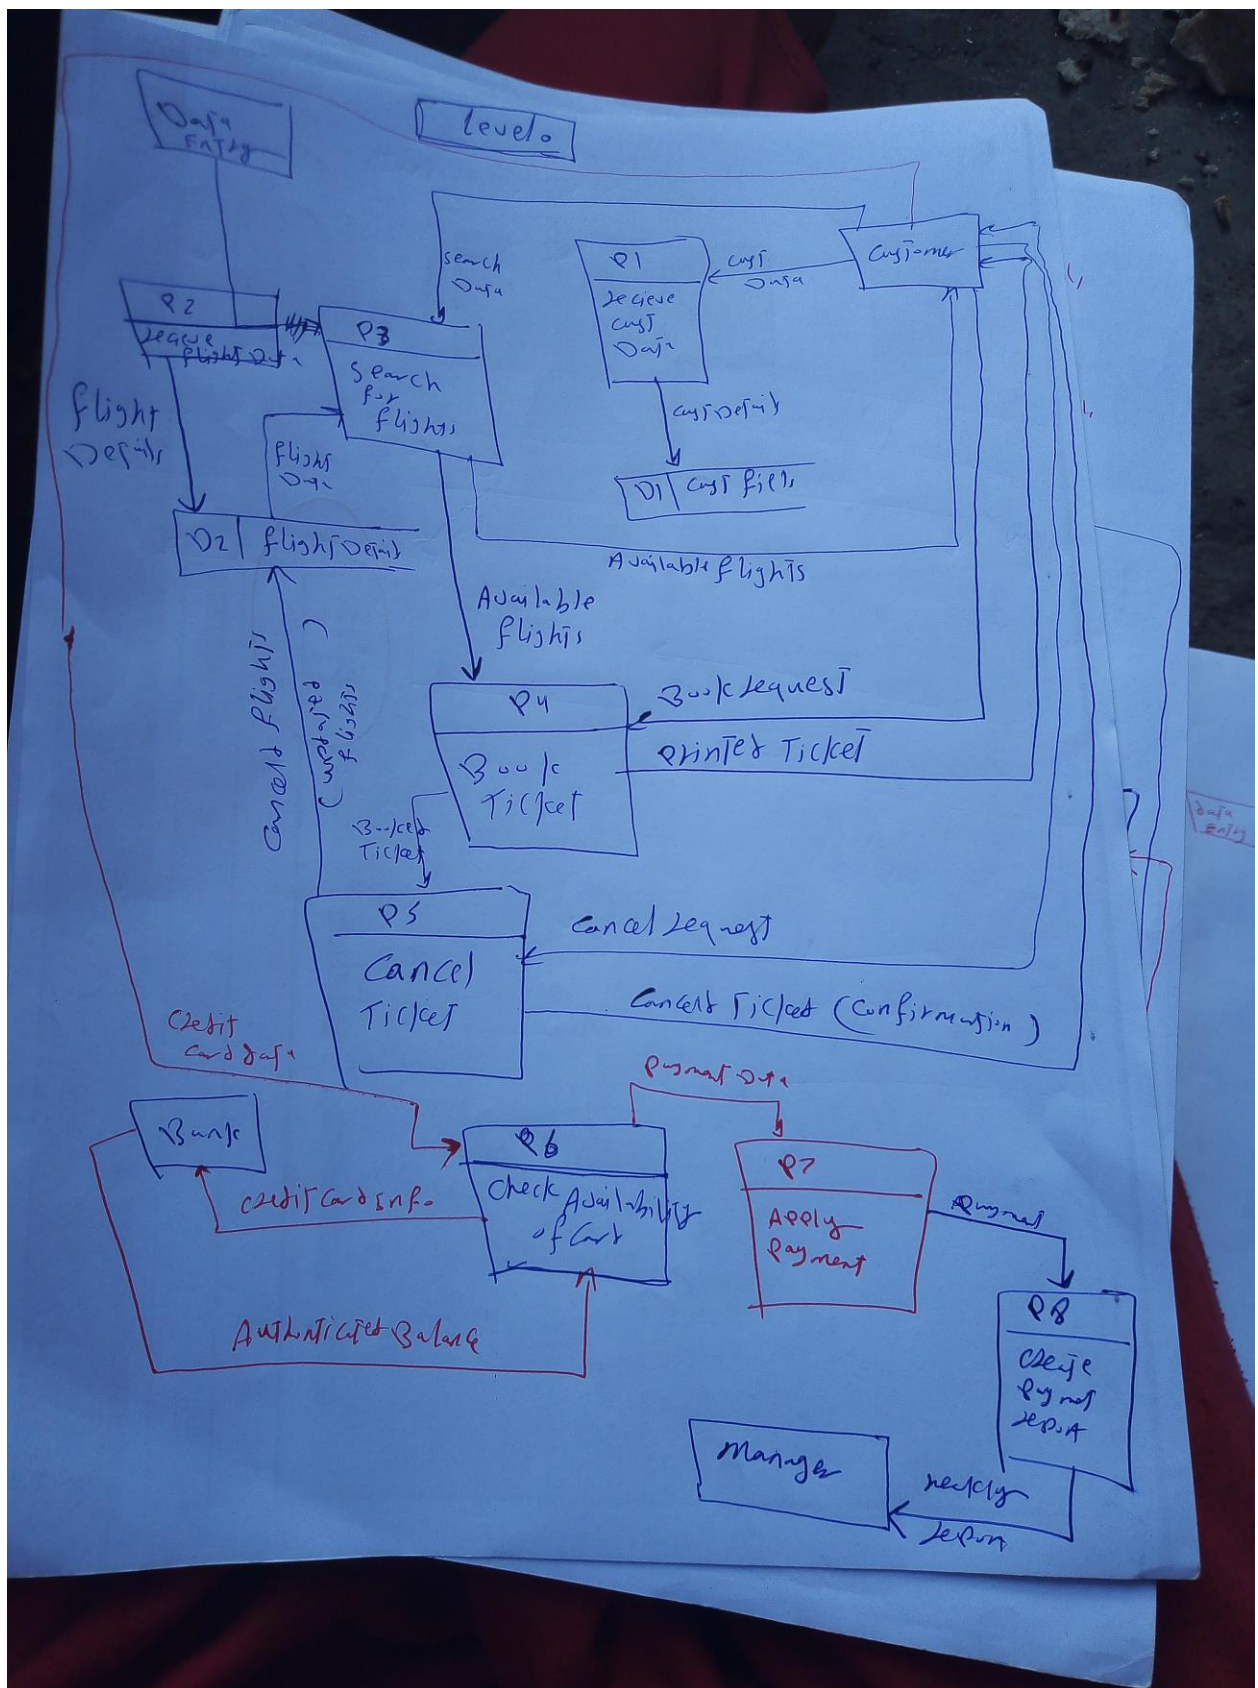

Draw the following DFD

Construct a context diagram and level0 for this scenario.

Context Diagram

Practice

- The purpose of the campus bookstore is to supply textbooks to students for classes at a local university. The university's academic departments submit initial data about courses, instructors, textbooks, and projected enrollments to the bookstore on a textbook master list. The bookstore generates a purchase order, which is sent to publishing companies supplying textbooks. Book orders arrive at the bookstore accompanied by a packing slip, which is checked and verified by the receiving department. Students fill out a book request that includes course information. When they pay for their books, the students are given a sales receipt.

Practice

Your client, Econ MiniBank, requests for a simple Automatic Teller Machine (ATM) system with the following requirements:

The system must be able to accept a customer's ATM card via a card reader and validate the account number using an account numbers file. The customer's transaction information, on the other hand, is entered via a key panel and also validated by the system. For valid account holders issuing valid transactions, the system determines the transaction type, which can be one of the following : display of account statement, hardcopy of account statement, cash transfers and requests for cheque book.

Transaction information would therefore include items like the customer's request (transaction type), cash transfer amount, and transferee's account number.

For account statement requests, the system retrieves the account information from a customer database and formats the information accordingly depending on whether a hardcopy or display is requested. For cash transfer requests, the cash amount and transferee's account number must be specified. Finally, for cheque book requests, the system uses a valid account number to determine

the collection center and collection date from a collection schedule log and prints a collection slip for the customer.
